

VDR PROCESSOR UPGRADE

CONVENIENT AND LOW COST SOLUTION

Ensuring the availability, supportability and compliance of Voyage Data Recorders (VDRs) and Simplified VDRs (SVDRs) is vital for both the ship operator and crew. Failure to have a working VDR system, can prevent a ship sailing. To ensure that your Kelvin Hughes VDR system is fully supportable, we recommend that those shipped from our factory before December 2006 are upgraded.

To replace an existing VDR system is a costly exercise, this is why Kelvin Hughes has developed a low cost and time efficient upgrade package for VDRs and SVDRs which addresses the obsolescence issues related to the processor and data acquisitions units of a VDR system.

UPGRADE

The VDR or SVDR upgrades are a convenient and low cost option for your existing processor and Data Acquisition Unit (DAU). The new MantaDigital™ VDR processor allows you to keep the original capture card and Crash Survivable Module (CSM), negating a large part of the cost of a replacement DAU. The new processor unit is a direct replacement for the original unit with existing wiring and fixings utilised and the styling and appearance maintained meaning it is easily recognisable and will interface to existing sensors and capsules.

PLAN AHEAD

Existing Kelvin Hughes VDR processors and DAUs from 2006 and earlier (Part Numbers VDR-A1 and VDR-A12) will soon no longer be supported, however the capture card and CSM is fully compatible with the upgrade package. It is recommended that all existing installations are upgraded before a problem occurs that could result in costly delays.

BENEFITS

- Low cost.
- Compatible with existing sensors and data capsule modules.
- Supportable.
- Easy installation.
- No training required.
